# Chapter 1. Quickstart

## 1.1. Configure repositories

The OL4JSF uses a local maven repository to deploy its artifacts. So, you'll need to tell Maven where to find them.

1. Edit <MAVEN\_REPOSITORY>/settings.xml

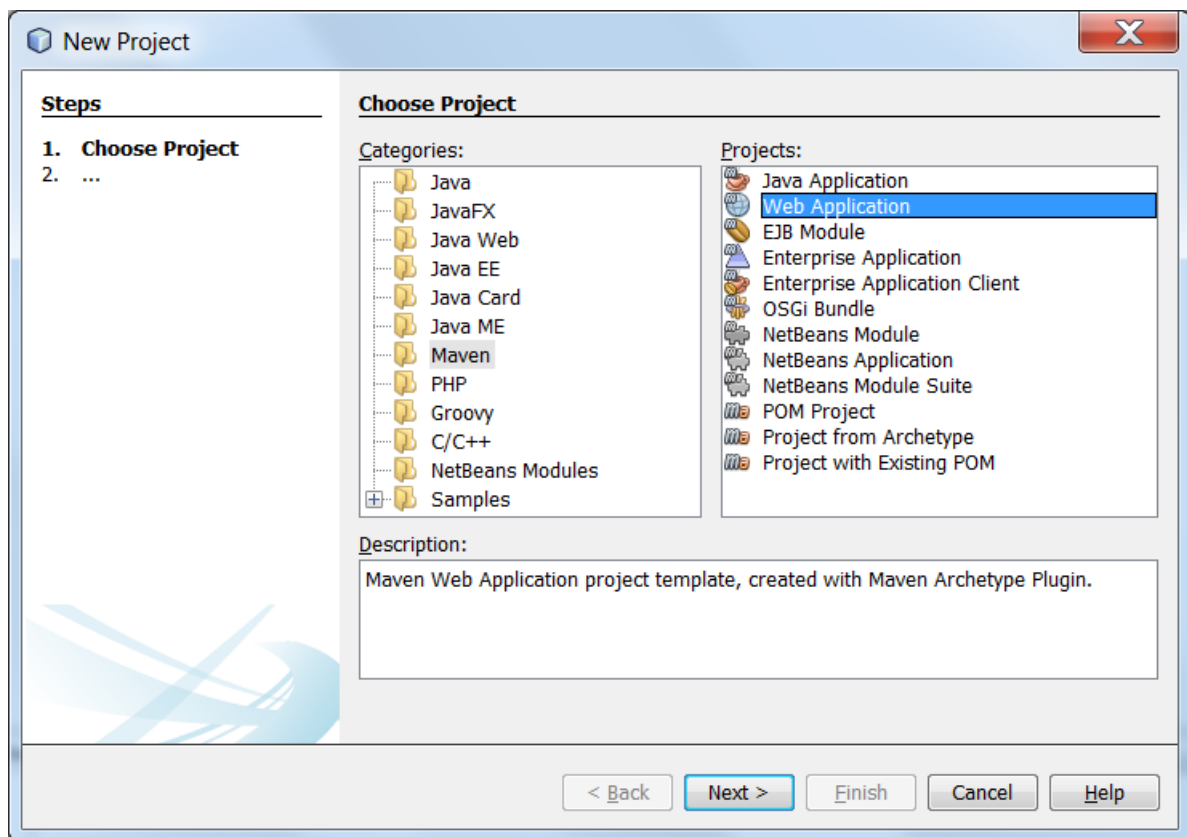

```
<settings xmlns="http://maven.apache.org/SETTINGS/1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/SETTINGS/1.0.0
http://maven.apache.org/xsd/settings-1.0.0.xsd">
  <profiles>
    <profile>
      <id>dev</id>
      <repositories>
        <repository>
          <id>maven2-repository.dev.java.net</id>
          <name>Java.net Repository for Maven</name>
          <url>http://download.java.net/maven/2/</url>
        </repository>
        <repository>
          <id>JBoss</id>
          <name>JBoss Repository</name>
          <url>https://repository.jboss.org/nexus/content/repositories/releases</url>
        </repository>
        <repository>
          <id>OL4JSF Local Repository</id>
          <name>OL4JSF</name>
          <url>https://java.net/svn/ol4jsf~svn/repository/</url>
        </repository>
      </repositories>
    </profile>
  </profiles>
  <activeProfiles>
    <!--make the profile active all the time -->
    <activeProfile>dev</activeProfile>
  </activeProfiles>
</settings>
```

## 1.2. Create a Maven project

Here we use the Netbeans IDE, but you can use any tool that you feel comfortable to work with.

1. New project...

Figure 1.1.

**Figure 1.2.**

The image shows the 'New Project' dialog box in NetBeans. The title bar says 'New Project' with a close button. On the left, a 'Steps' pane lists: 1. Choose Project, 2. **Name and Location**, and 3. Settings. The main area is titled 'Name and Location' and contains several text input fields: 'Project Name' (ol4jsfquickstart), 'Project Location' (C:\Temp\NetBeansProjects) with a 'Browse...' button, 'Project Folder' (C:\Temp\NetBeansProjects\ol4jsfquickstart), 'Artifact Id' (ol4jsfquickstart), 'Group Id' (com.mycompany), 'Version' (1.0-SNAPSHOT), and 'Package' (com.mycompany.ol4jsfquickstart) with a '(Optional)' label. At the bottom are buttons: '< Back', 'Next >', 'Finish', 'Cancel', and 'Help'.

Steps	
1.	Choose Project
2.	<b>Name and Location</b>
3.	Settings

Name and Location	
Project <u>N</u> ame:	ol4jsfquickstart
Project <u>L</u> ocation:	C:\Temp\NetBeansProjects <span>Browse...</span>
Project <u>F</u> older:	C:\Temp\NetBeansProjects\ol4jsfquickstart
<u>A</u> rtifact Id:	ol4jsfquickstart
<u>G</u> roup Id:	com.mycompany
<u>V</u> ersion:	1.0-SNAPSHOT
<u>P</u> ackage:	com.mycompany.ol4jsfquickstart (Optional)

< Back   Next >   Finish   Cancel   Help

**Figure 1.3.**

2. Add OL4JSF lib dependency to pom.xml

```
<dependencies>
...
<dependency>
  <groupId>org.ol4jsf</groupId>
  <artifactId>ol4jsf-core</artifactId>
  <version>
    2.6.1
  </version>
  <scope>compile</scope>
</dependency>
<!-- Uncomment if you are using JBoss 6 -->
<!--
<dependency>
  <groupId>xerces</groupId>
  <artifactId>xercesImpl</artifactId>
  <version>2.4.0</version>
  <scope>provided</scope>
</dependency>
-->
</dependencies>
```

3. Create a JSF Page...

Figure 1.4.

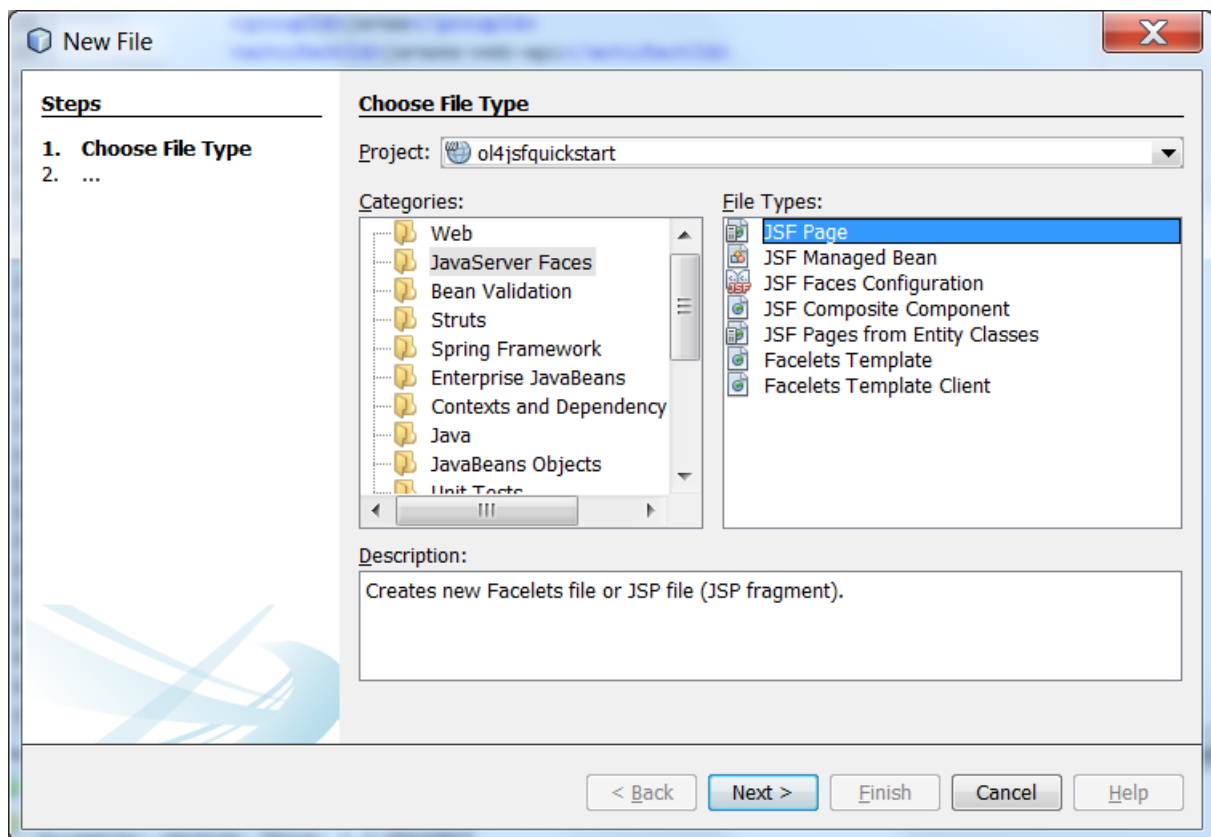

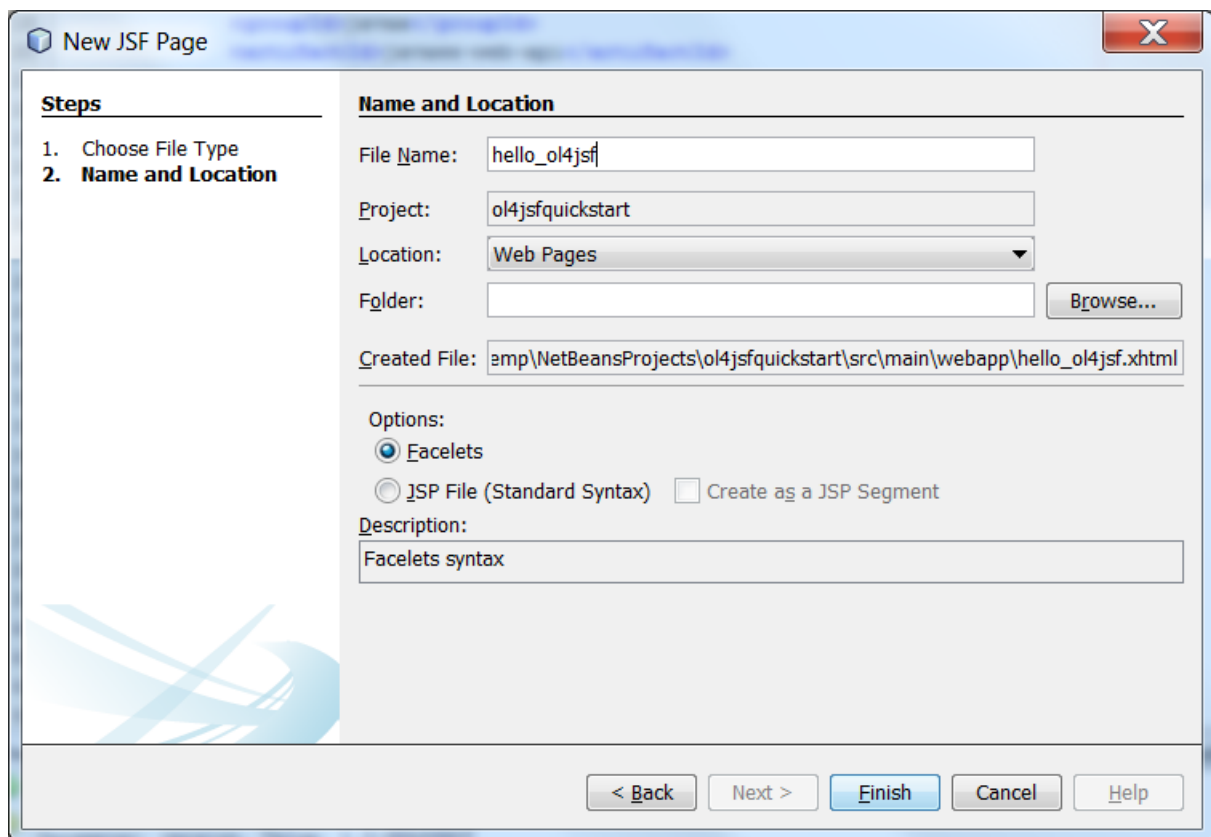

Figure 1.5.

4. ... with this code

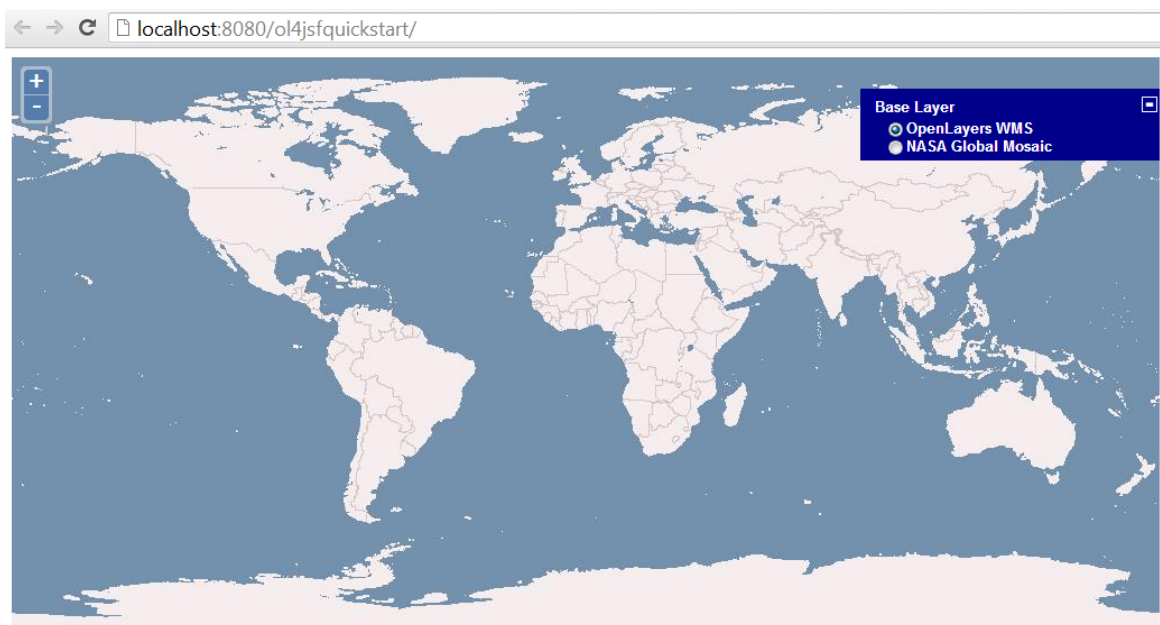

```
<?xml version='1.0' encoding='UTF-8' ?>
<!DOCTYPE
html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml"
      xmlns:h="http://java.sun.com/jsf/html"
      xmlns:m="http://www.ol4jsf.org">
  <h:head>
    <title>Hello World OL4JSF!</title>
  </h:head>
  <h:body>
    <m:map width="1024px" height="512px">
      <m:wmsLayer
        name="OpenLayers WMS"
        url="http://labs.metacarta.com/wms/vmap0"
        params="{layers:'basic'}" />
      <m:wmsLayer
        name="NASA Global Mosaic"
        url="http://t1.hypercube.telascience.org/cgi-bin/landsat7"
        params="{layers:'landsat7'}" />
      <m:layerSwitcherControl />
    </m:map>
  </h:body>
</html>
```

5. Change the web.xml

```
...  
<welcome-file-list>  
  <welcome-file>faces/hello_ol4jsf.xhtml</welcome-file>  
</welcome-file-list>
```

6. Run your project and you'll see your first map

**Figure 1.6.**

## Chapter 2. JSF Components

**Table 2.1. ajaxEvents**

Type	org.ol4jsf.AjaxEvents		
Enable ajax requests based on components events. Ex: https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/ajaxevents.xhtml https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/java/org/ol4jsf/bean/AjaxBean.java			
Name	Type	Required	Description
default	java.lang.String	true	The default event.
events	java.lang.String	true	Comma separated events.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.2. arcGIS93RestLayer**

Type	org.ol4jsf.ArcGIS93RestLayer		
Renderer	org.ol4jsf.component.layer.ArcGIS93RestLayerRenderer		
Instances of OpenLayers.Layer.ArcGIS93Rest are used to display data from ESRI ArcGIS Server 9.3 (and up?) Mapping Services using the REST API. More detail on the REST API is available at <a href="http://sampleserver1.arcgisonline.com/ArcGIS/SDK/REST/index.html">http://sampleserver1.arcgisonline.com/ArcGIS/SDK/REST/index.html</a> ; specifically, the URL provided to this layer should be an export service URL: <a href="http://sampleserver1.arcgisonline.com/ArcGIS/SDK/REST/export.html">http://sampleserver1.arcgisonline.com/ArcGIS/SDK/REST/export.html</a> . Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/arcgis93rest.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/arcgis93rest.xhtml</a>			
Name	Type	Re-quired	Description
name	java.lang.String	true	A name for the layer.
url	java.lang.String	true	Base url for the ArcGIS server REST service.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An javascript object with key/value pairs representing the options and option values. Valid Options: format: {String} MIME type of desired image type. layers: {String} Comma-sep-

Name	Type	Re- quired	Description
			arated list of layers to display. srs: {String} Projection ID..
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.3. arcGISCacheLayer**

Type	org.ol4jsf.ArcGISCacheLayer		
Renderer	org.ol4jsf.component.layer.ArcGISCacheLayerRenderer		
Wrapper for OL OpenLayers.Layer.ArcGISCache.			
Name	Type	Re- quired	Description
name	java.lang.String	true	A name for the layer.
url	java.lang.String	true	Base url for the ArcGISCache
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An javascript object with key/value pairs representing the options and option values. Valid Options: format: {String} MIME type of desired image type. layers: {String} Comma-separated list of layers to display. srs: {String} Projection ID..
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.4. attributionControl**

Type	org.ol4jsf.AttributionControl		
Renderer	org.ol4jsf.component.control.AttributionControlRenderer		
The attribution control adds attribution from layers to the map display. It uses 'attribution' property of each layer. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/attribution.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/attribution.xhtml</a>			
Name	Type	Required	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.

Name	Type	Re- quired	Description
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.5. bingLayer**

Type	org.ol4jsf.BingLayer		
Renderer	org.ol4jsf.component.layer.BingLayerRenderer		
Bing layer using direct tile access as provided by Bing Maps REST Services. See <a href="http://msdn.microsoft.com/en-us/library/ff701713.aspx">http://msdn.microsoft.com/en-us/library/ff701713.aspx</a> for more information. Note: Terms of Service compliant use requires the map to be configured with an OpenLayers.Control.Attribution control and the attribution placed on or near the map. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/bing.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/bing.xhtml</a>			
Name	Type	Re-quired	Description
key	java.lang.String	true	Bing Maps API key for your application. Get one at <a href="http://bingmapsportal.com/">http://bingmapsportal.com/</a> .
name	java.lang.String	true	A name for the layer.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An optional javascript object whose properties will be set on the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
type	java.lang.String	false	The layer identifier. Any non-bird-seye imageryType from <a href="http://msdn.microsoft.com/en-us/library/ff701716.aspx">http://msdn.microsoft.com/en-us/library/ff701716.aspx</a> can be used. Default is "Road".

**Table 2.6. control**

<b>Type</b>	org.ol4jsf.Control
-------------	--------------------

Renderer	org.ol4jsf.component.control.ControlRenderer		
Controls affect the display or behavior of the map. They allow everything from panning and zooming to displaying a scale indicator. Controls by default are added to the map they are contained within however it is possible to add a control to an external div by passing the div in the options parameter.			
Name	Type	Re-quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.7. deleteFeatureControl**

Type	org.ol4jsf.DeleteFeatureControl		
Renderer	org.ol4jsf.component.control.DeleteFeatureControlRenderer		
Control to delete a feature on map.			
Name	Type	Re- quired	Description
layer	java.lang.String	true	The layer(s) this control will delete features from.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.8. dragFeatureControl**

<b>Type</b>	org.ol4jsf.DragFeatureControl		
<b>Renderer</b>	org.ol4jsf.component.control.DragFeatureControlRenderer		

The DragFeature control moves a feature with a drag of the mouse.

Name	Type	Re- quired	Description
layer	java.lang.String	true	The layer(s) this control will Drag features from.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.9. drawFeatureControl**

Type	org.ol4jsf.DrawFeatureControl		
Renderer	org.ol4jsf.component.control.DrawFeatureControlRenderer		
The DrawFeature control draws point, line or polygon features on a vector layer when active.			
Name	Type	Re-quired	Description
handler	java.lang.String	true	Handler {OpenLayers.Handler}.
layer	java.lang.String	true	Layer name {OpenLayers.Layer.Vector}.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.10. editingToolbarControl**

<b>Type</b>	org.ol4jsf.EditingToolbarControl
<b>Renderer</b>	org.ol4jsf.component.control.EditingToolbarControlRenderer

The EditingToolbar is a panel of 4 controls to draw polygons, lines, points, or to navigate the map by panning. By default it appears in the upper right corner of the map. Ex: <https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/editingtoolbar.xhtml>

Name	Type	Required	Description
layer	java.lang.String	true	Layer name { OpenLayers.Layer.Vector }.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.11. geometryConverter**

Converter ID	org.ol4jsf.GeometryConverter		
Convert between String and Geometry objects. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/converter.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/converter.xhtml</a>			
Name	Type	Re-quired	Description
srid	java.lang.Integer	false	SRID. Default: -1

**Table 2.12. geoRSSLayer**

Type	org.ol4jsf.GeoRSSLayer		
Renderer	org.ol4jsf.component.layer.GeoRSSLayerRenderer		
Add GeoRSS Point features to your map.			
Name	Type	Re- quired	Description
location	java.lang.String	true	Location of the GeoRSS service.
name	java.lang.String	true	A name for the layer.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.

Name	Type	Re- quired	Description
			tional JavaScript code for the map to customize it.
options	java.lang.String	false	A javascript hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.13. getFeatureInfo**

Type	org.ol4jsf.GetFeatureInfo		
Renderer	org.ol4jsf.component.root.GetFeatureInfoRenderer		
Execute a GetFeatureInfo and call a user defined js function. Ex: https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/getfeatureinfo.xhtml			
Name	Type	Re- quired	Description
onCompleteJs-Func	java.lang.String	true	On complete javascript function.
queryLayers	java.lang.String	true	Layers to obtain feature info.
url	java.lang.String	true	URL service to load feature information.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
featurecount	java.lang.String	false	Maximum of features to receive.
format	java.lang.String	false	Format of the information response.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
onFailureJsFunc	java.lang.String	false	On failure javascript function.
onLoadingJsFunc	java.lang.String	false	Pre loading javascript function.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
srs	java.lang.String	false	SRID (default is projection of the map).

**Table 2.14. gmlLayer**

Type	org.ol4jsf.GMLLayer		
Renderer	org.ol4jsf.component.layer.GMLLayerRenderer		
Create a layer using the GML format.			
Name	Type	Re- quired	Description
name	java.lang.String	true	A name for the layer.
url	java.lang.String	true	URL of a GML file.

Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.15. googleLayer**

Type	org.ol4jsf.GoogleLayer		
Renderer	org.ol4jsf.component.layer.GoogleLayerRenderer		
Provides a wrapper for Google's Maps API Normally the Terms of Use for this API do not allow wrapping, but Google have provided written consent to OpenLayers for this - see email in <a href="http://os-geo-org.1560.n6.nabble.com/Google-Maps-API-Terms-of-Use-changes-tp4910013p4911981.html">http://os-geo-org.1560.n6.nabble.com/Google-Maps-API-Terms-of-Use-changes-tp4910013p4911981.html</a> Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/google.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/google.xhtml</a>			
Name	Type	Re-quired	Description
name	java.lang.String	true	A name for the layer.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An optional javascript object whose properties will be set on the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.16. icon**

<b>Type</b>	org.ol4jsf.Icon
<b>Renderer</b>	org.ol4jsf.component.root.IconRenderer

The icon represents a graphical icon on the screen. Typically used in conjunction with a `OpenLayers.Marker` to represent markers on a screen.

Name	Type	Re-quired	Description
sizeH	<code>java.lang.Integer</code>	true	Height of the image.
sizeW	<code>java.lang.Integer</code>	true	Width of the image.
url	<code>java.lang.String</code>	true	URL of the image.
binding	<code>javax.faces.component.UIComponent</code>	false	An el expression referring to a server side <code>UIComponent</code> instance in a backing bean.
calculateOffset	<code>java.lang.String</code>	false	JS function to calculate offset.
id	<code>java.lang.String</code>	false	Unique identifier of the component in a <code>namingContainer</code> .
jsVariable	<code>java.lang.String</code>	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
offsetX	<code>java.lang.Double</code>	false	Default: $-(\text{sizeW} / 2)$ .
offsetY	<code>java.lang.Double</code>	false	Default: $-\text{sizeH}$ .
rendered	<code>java.lang.Boolean</code>	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.17. `inputVectorLayer`**

Type	org.ol4jsf.InputVectorLayer		
Renderer	org.ol4jsf.component.layer.InputVectorLayerRenderer		
Input component to features. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/input_vector.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/input_vector.xhtml</a> <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/java/org/ol4jsf/bean/VectorBean.java">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/java/org/ol4jsf/bean/VectorBean.java</a>			
Name	Type	Re-quired	Description
name	java.lang.String	true	A name for the layer.
autoCenter	java.lang.Boolean	false	Automatically center the map based on the bound of features.
converterMessage	java.lang.String	false	Message to display when conversion fails.
domListener	java.lang.String	false	DOM ID element to receive the feature (WKT) if property dropFeatures-BeforeDraw is true.
dropFeaturesBeforeDraw	java.lang.Boolean	false	Indicates whether existing features must be deleted before adding the new.
immediate	java.lang.Boolean	false	When set true, process validations logic is executed at apply request values phase for this component. Default is false.

Name	Type	Re- quired	Description
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An optional javascript object whose properties will be set on the layer.
required	java.lang.Boolean	false	Marks component as required.
requiredMessage	java.lang.String	false	Message to display when required field validation fails.
transformation-Source	java.lang.String	false	A string identifying the Well Known Identifier for the projection.
transformationTarget	java.lang.String	false	A string identifying the Well Known Identifier for the projection. If transformationSource is set, the transformationTarget default is "map.getProjectionObject()".
validator	javax.faces.validator.Validator	false	A method expression referring to a method validating the input.
validatorMessage	java.lang.String	false	Message to display when validation fails.
value	java.lang.String	false	Well Known Text objects to be drawn (WKTFeaturesCollection API).
valueChangeListener	javax.faces.event.ValueChangeListener	false	A method binding expression referring to a method for handling a value change event.

**Table 2.18. keyboardDefaultsControl**

Type	org.ol4jsf.KeyboardDefaultsControl		
Renderer	org.ol4jsf.component.control.KeyboardDefaultsControlRenderer		
The KeyboardDefaults control adds panning and zooming functions, controlled with the keyboard. By default arrow keys pan, +/- keys zoom & Page Up/Page Down/Home/End scroll by three quarters of a page.			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.

Name	Type	Re- quired	Description
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.19. layerSwitcherControl**

Type	org.ol4jsf.LayerSwitcherControl		
Renderer	org.ol4jsf.component.control.LayerSwitcherControlRenderer		
The LayerSwitcher control displays a table of contents for the map. This allows the user interface to switch between BaseLasayers and to show or hide Overlays. By default the switcher is shown minimized on the right edge of the map, the user may expand it by clicking on the handle.			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.20. map**

Type	org.ol4jsf.Map		
Renderer	org.ol4jsf.component.map.MapRenderer		
Instances of OpenLayers.Map are interactive maps embedded in a web page. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/example.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/example.xhtml</a>			
Name	Type	Re- quired	Description
converterMessage	java.lang.String	false	Message to display when conversion fails.
debug	java.lang.Boolean	false	This flag determines whether to render the map's script wrapping and indent lines.
height	java.lang.String	false	The height of the map. Default value is 256px.
immediate	java.lang.Boolean	false	When set true, process validations logic is executed at apply request values phase for this component. Default is false.

Name	Type	Re- quired	Description
includeOLScript	java.lang.Boolean	false	This flag determines whether to include the built-in OpenLayers.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	A Optional javascript object with properties to tag onto the map.
renderOnWindowLoad	java.lang.Boolean	false	This flag determines whether to render the map on window load. This flag should be set to false if the map is inside a zone that will be updated by Ajax
required	java.lang.Boolean	false	Marks component as required.
requiredMessage	java.lang.String	false	Message to display when required field validation fails.
theme	java.lang.String	false	The theme used by built in OL. Use 'none' to not include any theme.
transformation-Source	java.lang.String	false	A string identifying the Well Known Identifier for the projection.
transformationTarget	java.lang.String	false	A string identifying the Well Known Identifier for the projection. If transformationSource is set, the transformationTarget default is "map.getProjectionObject()".
validator	javax.faces.validator.Validator	false	A method expression referring to a method validating the input.
validatorMessage	java.lang.String	false	Message to display when validation fails.
valueChangeListener	javax.faces.event.ValueChangeListener	false	A method binding expression referring to a method for handling a valuechange event.
width	java.lang.String	false	The width of the map. Default value is 512px.

**Table 2.21. mapServerLayer**

Type	org.ol4jsf.MapServerLayer		
Renderer	org.ol4jsf.component.layer.MapServerLayerRenderer		
Instances of OpenLayers.Layer.MapServer are used to display data from a MapServer CGI instance.			
Name	Type	Re- quired	Description
name	java.lang.String	true	A name for the layer.
params	java.lang.String	true	A javascript object with key/value pairs representing the GetMap query string parameters and parameter values.

Name	Type	Re- quired	Description
url	java.lang.String	true	Base url for the MapServer CGI.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	A javascript hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.22. marker**

Type	org.ol4jsf.Marker		
Renderer	org.ol4jsf.component.root.MarkerRenderer		
Wrapper for OpenLayers.Marker. Ex: https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/markers.xhtml			
Name	Type	Required	Description
lat	java.lang.Double	true	Latitude.
lon	java.lang.Double	true	Longitude.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
icon	java.lang.String	false	Icon to use in this marker.
iconClone	java.lang.Boolean	false	Define if the marker must use a clone of the icon (default: true).
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
transformation-Source	java.lang.String	false	A string identifying the Well Known Identifier for the projection.
transformationTarget	java.lang.String	false	A string identifying the Well Known Identifier for the projection. If

Name	Type	Re- quired	Description
			transformationSource is set, the transformationTarget default is "map.getProjectionObject()".

**Table 2.23. markersLayer**

Type	org.ol4jsf.MarkersLayer		
Renderer	org.ol4jsf.component.layer.MarkersLayerRenderer		
Wrapper for OpenLayers.Layers.Markers. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/markers.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/markers.xhtml</a>			
Name	Type	Re- quired	Description
name	java.lang.String	true	A name for the layer.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
icon	java.lang.String	false	Icon reference to share among markers.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.24. measureControl**

Type	org.ol4jsf.MeasureControl		
Renderer	org.ol4jsf.component.control.MeasureControlRenderer		
Allows for drawing of features for measurements. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/measure.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/measure.xhtml</a>			
Name	Type	Re-quired	Description
handler	java.lang.String	true	Handler {OpenLayers.Handler}.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this

Name	Type	Re- quired	Description
			attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.25. modifyFeatureControl**

Type	org.ol4jsf.ModifyFeatureControl		
Renderer	org.ol4jsf.component.control.ModifyFeatureControlRenderer		
Control to modify features. When activated, a click renders the vertices of a feature - these vertices can then be dragged. By default, the delete key will delete the vertex under the mouse. New features are added by dragging 'virtual vertices' between vertices.			
Name	Type	Re- quired	Description
layer	java.lang.String	true	The layer(s) this control will modify features from.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.26. mousePositionControl**

Type	org.ol4jsf.MousePositionControl		
Renderer	org.ol4jsf.component.control.MousePositionControlRenderer		
The MousePosition control displays geographic coordinates of the mouse pointer, as it is moved about the map.			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring

Name	Type	Re- quired	Description
			to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.27. navigationControl**

Type	org.ol4jsf.NavigationControl		
Renderer	org.ol4jsf.component.control.NavigationControlRenderer		
The navigation control handles map browsing with mouse events (dragging, double-clicking, and scrolling the wheel).			
Name	Type	Re-quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.28. ol4jsfResource**

Type	org.ol4jsf.component.OL4jsfResource		
Renderer	org.ol4jsf.component.OL4jsfResourceRenderer		
Used internally by OL4JSF to render css and js resources.			
Name	Type	Re- quired	Description
name	java.lang.String	false	Path of the resource to be exluded.

**Table 2.29. oleToolbarControl**

<b>Type</b>	org.ol4jsf.OleToolbarControl
<b>Renderer</b>	org.ol4jsf.component.control.OleToolbarControlRenderer
Create a toolbar based on <a href="http://ole.geops.de/">http://ole.geops.de/</a> . Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/oletoolbar.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/oletoolbar.xhtml</a>	

Name	Type	Re- quired	Description
activeControls	java.lang.String	false	Active features in control. Default: ['Navigation','SnappingSettings','Separator','SplitFeature',
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
editLayer	java.lang.String	false	Vector layer to plot in. Default is ole internal.
featureTypes	java.lang.String	false	Features supported. Default: ['polygon', 'path', 'point']
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.30. osmLayer**

Type	org.ol4jsf.OSMLayer		
Renderer	org.ol4jsf.component.layer.OSMLayerRenderer		
This layer allows accessing OpenStreetMap tiles. By default the OpenStreetMap hosted tile.openstreetmap.org Mapnik tileset is used. If you wish to use a different layer instead, you need to provide a different URL to the constructor. Ex: https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/osm.xhtml			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
name	java.lang.String	false	A name for the layer.
options	java.lang.String	false	Hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
url	java.lang.String	false	URL of a OSM service.

**Table 2.31. overviewMapControl**

Type	org.ol4jsf.OverviewMapControl		
Renderer	org.ol4jsf.component.control.OverviewMapControlRenderer		
The OverMap control creates a small overview map, useful to display the extent of a zoomed map and your main map and provide additional navigation options to the User. By default the overview map is drawn in the lower right corner of the main map.			
Name	Type	Re-quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
object	java.lang.String	false	Properties of this object will be set on the overview map object. Note, to set options on the map object contained in this control, set mapOptions as one of the options properties.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.32. panelControl**

Type	org.ol4jsf.PanelControl		
Renderer	org.ol4jsf.component.control.PanelControlRenderer		
The Panel control is a container for other controls. With it toolbars may be composed.			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An optional javascript object whose properties will be set on the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.33. panZoomBarControl**

Type	org.ol4jsf.PanZoomBarControl		
Renderer	org.ol4jsf.component.control.PanZoomBarControlRenderer		
The PanZoom is a visible control, composed of a OpenLayers.Control.PanPanel and a OpenLayers.Control.ZoomPanel. By default it is drawn in the upper left corner of the map.			
Name	Type	Re-quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.34. permalinkControl**

<b>Type</b>	org.ol4jsf.PermalinkControl		
<b>Renderer</b>	org.ol4jsf.component.control.PermalinkControlRenderer		
The Permalink control is hyperlink that will return the user to the current map view. By default it is drawn in the lower right corner of the map. The href is updated as the map is zoomed, panned and whilst layers are switched.			
<b>Name</b>	<b>Type</b>	<b>Re-quired</b>	<b>Description</b>
base	java.lang.String	false	String.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
element	java.lang.String	false	DOMElement.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.35. registerEvent**

Type	org.ol4jsf.RegisterEvent		
Register events on Openlayers objects. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/events.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/events.xhtml</a>			
Name	Type	Re-quired	Description
jsFunc	java.lang.String	true	The callback function.
type	java.lang.String	true	Name of the event to register.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
obj	java.lang.String	false	The object to bind the context to for the callback. If no object is specified, default is the Events' object property.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.36. scaleLineControl**

Type	org.ol4jsf.ScaleLineControl		
Renderer	org.ol4jsf.component.control.ScaleLineControlRenderer		
The ScaleLine displays a small line indicator representing the current map scale on the map. By default it is drawn in the lower left corner of the map.			
Name	Type	Re-quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.37. script**

<b>Type</b>	org.ol4jsf.Script
<b>Renderer</b>	org.ol4jsf.component.script.ScriptRenderer
Add custom scripts on components. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/panel.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/panel.xhtml</a>	

Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.38. selectFeatureControl**

Type	org.ol4jsf.SelectFeatureControl		
Renderer	org.ol4jsf.component.control.SelectFeatureControlRenderer		
The SelectFeature control selects vector features from a given layer on click or hover.			
Name	Type	Re- quired	Description
layers	java.lang.String	true	Comma separated vector layers. The layer(s) this control will select features from.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.39. tmsLayer**

<b>Type</b>	org.ol4jsf.TMSLayer		
<b>Renderer</b>	org.ol4jsf.component.layer.TMSLayerRenderer		
Create a layer for accessing tiles from services that conform with the Tile Map Service Specification ( <a href="http://wiki.osgeo.org/wiki/Tile_Map_Service_Specification">http://wiki.osgeo.org/wiki/Tile_Map_Service_Specification</a> ).			
<b>Name</b>	<b>Type</b>	<b>Re- quired</b>	<b>Description</b>
name	java.lang.String	true	A name for the layer.
url	java.lang.String	true	URL of a TML file.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a back- ing bean.

Name	Type	Re- quired	Description
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.40. vectorLayer**

Type	org.ol4jsf.VectorLayer		
Renderer	org.ol4jsf.component.layer.VectorLayerRenderer		
Instances of OpenLayers.Layer.Vector are used to render vector data from a variety of sources.			
Name	Type	Re-quired	Description
name	java.lang.String	true	A name for the layer.
autoCenter	java.lang.Boolean	false	Automatically center the map based on the bound of features.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
domListener	java.lang.String	false	DOM ID element to receive the feature (WKT) if property dropFeatures-BeforeDraw is true.
dropFeaturesBeforeDraw	java.lang.Boolean	false	Indicates whether existing features must be deleted before adding the new.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	An optional javascript object whose properties will be set on the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
transformation-Source	java.lang.String	false	A string identifying the Well Known Identifier for the projection.

Name	Type	Re- quired	Description
transformationTarget	java.lang.String	false	A string identifying the Well Known Identifier for the projection. If transformationSource is set, the transformationTarget default is "map.getProjectionObject()".
value	java.lang.String	false	Well Known Text objects to be draw (Use WKTFeaturesCollection).

**Table 2.41. wfsLayer**

Type	org.ol4jsf.WFSLayer		
Renderer	org.ol4jsf.component.layer.WFSLayerRenderer		
Create a layer using the WFS protocol. Ex: <a href="https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/wfsexample.xhtml">https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/wfsexample.xhtml</a>			
Name	Type	Required	Description
name	java.lang.String	true	A name for the layer.
params	java.lang.String	true	A javascript object with key/value pairs representing the GetMap query string parameters and parameter values.
url	java.lang.String	true	Base url for the WFS.
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	A javascript hashtable of extra options to tag onto the layer.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.42. wmsGetFeatureInfoControl**

Type	org.ol4jsf.WMSGetFeatureInfoControl		
Renderer	org.ol4jsf.component.control.WMSGetFeatureInfoControlRenderer		
Show a popup using WMSGetFeatureInfo. Ex: https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/wmsgetfeatureinfo.xhtml			
Name	Type	Re-quired	Description
url	java.lang.String	true	URL service to load feature information.

Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
closeBox	java.lang.Boolean	false	Inform if popup can be closed
contentHTML	java.lang.String	false	HTML to draw the popup
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
layers	java.lang.String	false	Layers name to obtain feature info.
popupType	java.lang.String	false	The type of the popup.
queryVisible	java.lang.Boolean	false	Inform if the query is visible.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
title	java.lang.String	false	ID of the WMSGetFeatureInfo.

**Table 2.43. wmsLayer**

Type	org.ol4jsf.WMSLayer		
Renderer	org.ol4jsf.component.layer.WMSLayerRenderer		
Instances of OpenLayers.Layer.WMS are used to display data from OGC Web Mapping Services.			
Name	Type	Re- quired	Description
name	java.lang.String	true	A name for the layer.
params	java.lang.String	true	A javascript object with key/value pairs representing the GetMap query string parameters and parameter values.
url	java.lang.String	true	Base url for the WMS.
converterMessage	java.lang.String	false	Message to display when conversion fails.
immediate	java.lang.Boolean	false	When set true, process validations logic is executed at apply request values phase for this component. Default is false.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	A javascript hashtable of extra options to tag onto the layer.

Name	Type	Re- quired	Description
required	java.lang.Boolean	false	Marks component as required.
requiredMessage	java.lang.String	false	Message to display when required field validation fails.
validator	javax.faces.validator.Validator	false	A method expression referring to a method validating the input.
validatorMessage	java.lang.String	false	Message to display when validation fails.
valueChangeListener	javax.faces.event.ValueChangeListener	false	A method binding expression referring to a method for handling a valuechange event.

**Table 2.44. zoomBoxControl**

Type	org.ol4jsf.ZoomBoxControl		
Renderer	org.ol4jsf.component.control.ZoomBoxControlRenderer		
The ZoomBox control enables zooming directly to a given extent, by drawing a box on the map. The box is drawn by holding down shift, whilst dragging the mouse.			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to use write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

**Table 2.45. zoomToMaxExtentControl**

Type	org.ol4jsf.ZoomToMaxExtentControl		
Renderer	org.ol4jsf.component.control.ZoomToMaxExtentControlRenderer		
The ZoomToMaxExtent control is a button that zooms out to the maximum extent of the map. It is designed to be used with a OpenLayers.Control.Panel.			
Name	Type	Re- quired	Description
binding	javax.faces.component.UIComponent	false	An el expression referring to a server side UIComponent instance in a backing bean.
id	java.lang.String	false	Unique identifier of the component in a namingContainer.

Name	Type	Re- quired	Description
jsVariable	java.lang.String	false	This flag determines the JavaScript variable you want to use for referring to the map. It should be unique. Use this attribute if you want to write additional JavaScript code for the map to customize it.
options	java.lang.String	false	Hashtable of extra options.
rendered	java.lang.Boolean	false	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

---

# Chapter 3. Using OL4JSFProxy

The OL4JSF provides a proxy to pass and retrieve information from remote domains via an XHR. It's an alternative to ProxyHost [<http://trac.osgeo.org/openlayers/wiki/FrequentlyAskedQuestions#ProxyHost>] variable provided by OpenLayers.

## 3.1. Configuration file

The OL4JSF Proxy servlet is mapped by a web-fragment in ol4jsf-core-2.6.1.jar. If your container does not support the Servlet 3.0 specification you must add the following mapping manually.

```
<servlet>
  <servlet-name>OL4JSFProxy</servlet-name>
  <servlet-class>org.ol4jsf.proxy.servlet.OL4JSFProxy</servlet-class>
  <load-on-startup>0</load-on-startup>
</servlet>

<servlet-mapping>
  <servlet-name>OL4JSFProxy</servlet-name>
  <url-pattern>/OL4JSFProxy/*</url-pattern>
</servlet-mapping>
```

This servlet looks for a file named ol4jsf-proxy.xml under WEB-INF/classes of the web application. The following code represents a valid configuration file.

```
<?xml version="1.0" encoding="UTF-8"?>
<ol4jsf-proxy>
  <use-environment id="test" />
  <environment id="desenv">
    <description>Development Environment.</description>
    <resources>
      <resource name="wfs">
        <url>http://demo.opengeo.org/geoserver/wfs</url>
      </resource>
      <resource name="wms">
        <url>http://demo.opengeo.org/geoserver/wms</url>
      </resource>
    </resources>
  </environment>
  <environment id="test">
    <description>Test Environment.</description>
    <resources>
      <resource name="wfs">
        <url>http://localhost:9080/geoserver/wfs</url>
      </resource>
      <resource name="wms">
        <url>http://localhost:9080/geoserver/wms</url>
      </resource>
    </resources>
  </environment>
</ol4jsf-proxy>
```

### 3.1.1. Authenticated resources

The OL4JSFProxy supports basic authentication to access protected resources. For instance, if your GeoServer provides WMS services only to a certain user, you must set this information in the configuration file.

```
<?xml version="1.0" encoding="UTF-8"?>
<ol4jsf-proxy>
  <use-environment id="test" />
  ...
  <environment id="test">
    <description>Test Environment.</description>
    <resources>
      ...
      <resource name="wms">
        <url>http://localhost:9080/geoserver/wms</url>
        <authentication>
          <username>admin</username>
          <password>geoserver</password>
        </authentication>
      </resource>
    </resources>
  </environment>
</ol4jsf-proxy>
```

## 3.2. Accessing resources through the OL4JSFProxy

The OL4JSFProxy expects the pattern:

```
#${facesContext.getExternalContext().requestContextPath}/OL4JSFProxy/<resource name>
```

Thus, it is very easy to use OL4JSFProxy!

```
<m:map width="512px" height="256px" theme="black">
  <m:wmsLayer
    name="OpenLayers WMS"
    url="http://labs.metacarta.com/wms/vmap0"
    params="{layers:'basic'}" />
  <m:wfsLayer
    name="States"
    params="{
      featureType: 'states',
      featureNS: 'http://www.openplans.org/topp'
    }" />
```

```
        url="#{facesContext.externalContext.requestContextPath}/OL4JSFProxy/wfs" />
    <m:layerSwitcherControl />
</m:map>
```

Some benefits of using OL4JSFProxy:

- Use different servers (resources) to different environments;
- Do not expose your servers map directly to Internet;
- No JavaScript security restrictions;
- It's simple.

---

# Chapter 4. Populating features with WKTFeatureCollection

OL4JSF provides a way to pass features directly to your vector layer (with `<m:vectorLayer>` and `<m:inputVectorLayer>`) without need a map server. Thus, you can create your features in memory or load them from a database using JPA/JDBC.

## Example 4.1. Populating WKTFeatures in a managed bean

```
@ManagedBean
@RequestScoped
public class VectorBean {
    ...
    public String getWkts() {
        WKTFeaturesCollection features = new WKTFeaturesCollection();

        features.addFeature(new FeatureVector("POINT(0 0)"));

        Map<String,String> attr = new HashMap<String,String>();
        attr.put("myattr", "feature's attribute value");

        Map<String,String> style = new HashMap<String,String>();
        style.put("fillColor", "#FF0000");
        features.addFeature(new FeatureVector("POINT(30 30)", attr, style));

        return features.toMap();
    }
    ...
}
```

Now, you can render this features in your XHTML page:

```
<m:map width="512px" height="256px">
    ...
    <m:vectorLayer name="Features" value="#{vectorBean.wkts}" />
    ...
</m:map>
```

You can find a complete example here:

- Demonstrate a vector layer rendering features from a managed bean. [[https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/vector\\_managedbean.xhtml](https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/vector_managedbean.xhtml)]
- Managed bean source code. [<https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/java/org/ol4jsf/bean/VectorBean.java>]

---

# Chapter 5. OL4JSF and Bean Validation

OL4JSF implements a `GeometryType` validator based on JSR 303 (Bean Validation). So, it's very simple to validate your geometries using input components (e.g. `<m:inputVectorLayer>`) in combination with `<m:geometryConverter>`.

```
//--> in your jsf page
<h:messages showDetail="true" showSummary="false" />
<m:map width="512px" height="256px" options="{controls:[]}">
    ...
    <m:inputVectorLayer
        name="Features"
        value="#{beanValidationExample.feature}">
        <m:geometryConverter srid="4326" />
    </m:inputVectorLayer>
    ...
</m:map>

//--> in your managed bean
@ManagedBean
@RequestScoped
public class BeanValidationExample {

    @GeometryType(srid = 4326, type = Point.class)
    private Geometry feature;

    //getters and setters
}
```

This way, you can have more control about what is sent to your servers, accepting only geometries with valid type and SRID.

You can find a complete example here:

- Demonstrating bean validation with OL4JSF. [[https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/bean\\_validation.xhtml](https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/webapp/pages/bean_validation.xhtml)]
- Managed bean source code. [<https://svn.java.net/svn/ol4jsf~svn/examples/trunk/src/main/java/org/ol4jsf/bean/BeanValidationExample.java>]

---

# Chapter 6. Theme Support

It's easy to use, create and share themes with OL4JSF.

## 6.1. Creating a new theme

1. Configure your repository ( Section 1.1, “Configure repositories”).
2. Generate the theme project:

```
mvn archetype:generate
-DarchetypeGroupId=org.ol4jsf.archetype
-DarchetypeArtifactId=ol4jsf-theme
-DarchetypeVersion=1.0
-DgroupId=org.ol4jsf.theme
-DartifactId=green
```

3. Customize CSS, JS and image files;
4. Install the new theme in your local repository:

```
mvn clean install
```

## 6.2. Using the new theme

1. Configure your pom.xml (in the WAR project) or add the JAR theme to your webapp classpath;

```
<dependency>
  <groupId>org.ol4jsf.theme</groupId>
  <artifactId>green</artifactId>
  <version>1.0-SNAPSHOT</version>
</dependency>
```

2. Configure the desired theme on your map:

```
<m:map width="512px" height="256px" theme="green">
  ...
</m:map>
```

---

# Chapter 7. Running the OL4JSF Examples Project

The OL4JSF2 Examples Project contains many examples that can help you to develop your own applications.

## 7.1. Using Netbeans

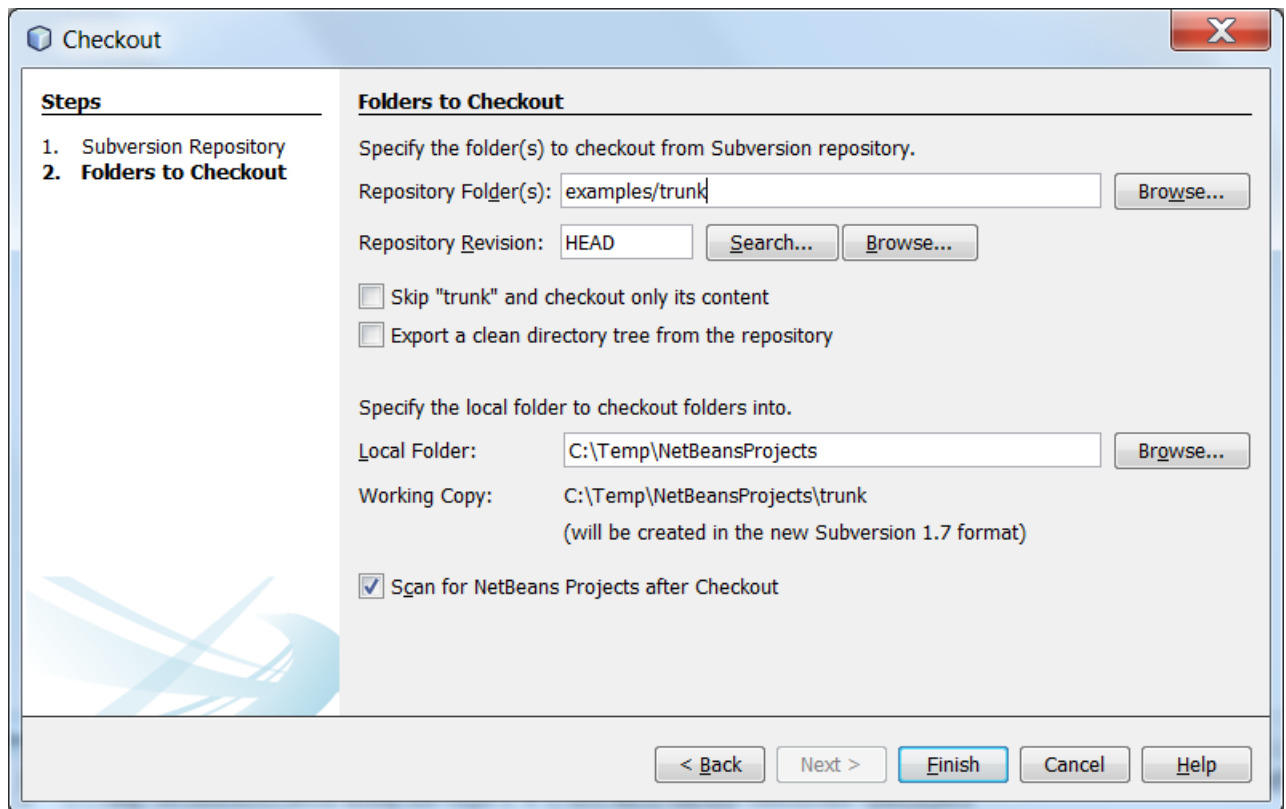

1. Configure your repository ( Section 1.1, “Configure repositories”).
2. Team → Subversion → Checkout...
3. Subversion repository

The screenshot shows the 'Checkout' dialog box in NetBeans, specifically the 'Subversion Repository' step. The dialog has a title bar with a close button (X). On the left, a 'Steps' pane shows '1. Subversion Repository' and '2. Folders to Checkout'. The main area is titled 'Subversion Repository' and contains the following fields and controls:

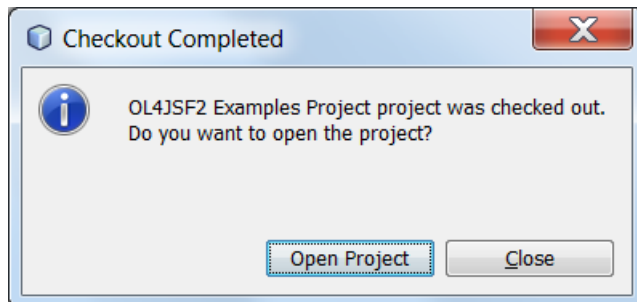

- Repository URL:** A text field containing 'https://svn.java.net/svn/ol4jsf~svn/examples/trunk' with a dropdown arrow. Below it is a hint: 'https://hostname/repository\_path[@REV]'.
- User:** A text field with the instruction '(leave blank for anonymous access)'.
- Password:** A text field.
- ☐ **Save Username and Password**
- Client Certificate File:** A text field with a 'Browse...' button.
- Passphrase:** A text field.
- Proxy Configuration...** button.

At the bottom of the dialog are five buttons: '< Back', 'Next >', 'Finish', 'Cancel', and 'Help'.

4. Folders to checkout

5. Open the project

6. Run and select the deployment server

7. Enjoy it!
